methods for solving problems of mathematical physics can be divided into the following four classes analytical methods the method of separation of variables the method of characteristics the method of green's functions etc methods have a relatively low degree of universality i.e. focused on solving rather narrow classes of problems approximate analytical methods projection variational methods small parameter method operational methods various iterative methods are more versatile than analytical ones numerical methods finite difference method direct method control volume method finite element method etc are very universal methods probabilistic methods monte carlo methods are highly versatile can be used to calculate discontinuous solutions however they require large amounts of calculations and as a rule they lose with the computational complexity of the above methods when solving such problems to which these methods are applicable comparing methods for solving problems of mathematical physics it is impossible to give unconditional primacy to any of them any of them may be the best for solving problems of a certain class the proposed method of moving nodes for boundary value problems of differential equations combines a combination of numerical and analytical methods in this case we can obtain on the one hand an approximately analytical solution of the problem which is not related to the methods listed above on the other hand this method allows one to obtain compact discrete approximations of the original problem note that obtaining an approximately analytical solution of differential equations is based on numerical methods the nature of numerical methods also allows obtaining an approximate analytical expression for solving differential equations

microorganisms play an important role in life on earth and can adapt and survive in harsh and changing environments their aptitude to thrive under hostile conditions is reflected by their survival and activity in some of the most extreme environments on earth and their presence and growth in low earth orbit and outer space spaceflight and the space environment have a unique set of stressors compared to earth microgravity galactic cosmic radiation solar uv radiation space vacuum thermal extremes that microbes are exposed to but how they adapt and respond is still poorly understood studies to date though have shown that these responses can range from being beneficial for human exploration to negatively impact long duration missions hence investigating the reaction of microorganisms to space conditions the alterations in their physiology and virulence not only helps shed light on the molecular basis of tolerance but has implications for both space exploration and astrobiological missions
